

Ecosystem Services of Russia

Volume 1

Services of Terrestrial Ecosystems

Prototype of National Report

<http://www.biodiversity.ru/programs/ecoservices/first-steps/PrototypeES2015.pdf>

Project director – A. Zimenko. **Project coordinator** – A. Grigorjan. **Edited and compiled by:** E. Bukvareva, D. Zamolodchikov.

Experts: S. Bobylev, E. Bukvareva, V. Grabovsky, A. Danilkin, Yu. Dgebuadze, A. Drozdov, O. Filenko, A. Khoroshev, G. Kraev, A. Narykov, R. Perelet, B. Striganova, A. Tischkov, D. Zamolodchikov. **External experts:** K. Grunewald, O. Bastian

The assessment of ES of Russia was carried out by the Biodiversity Conservation Center (Moscow) in cooperation with Leibniz Institute of Ecological Urban and Regional Development (Dresden) in 2013-2015 in the framework of the Russian-German project "TEEB-Russia 1. Ecosystem Services Evaluation in Russia: First Steps" with the financial support of the German Federal Agency for Nature Conservation (BfN).

Units of assessment are subjects of the Russian Federation (the top-level administrative units), because the whole bunch of socio-economic data as well as some environmental indicators was obtained from governmental databases where it is provided on the level of subjects of the Russian Federation.

Methods of assessment. Depending on the data availability and methodological clarity the following methods were used.

1. Direct quantitative evaluation when quantitative statistical data are available on stocks and use of resources.

2. Indirect quantitative evaluation based on combination of other quantitative data on regional ecosystems and economy.

3. Score in points if there is no data to evaluate ES itself and if it is possible to estimate only factors affecting it.

4. Formulation of the task of ES assessment, if methodological approaches aren't ready for the above methods or failed to get data

ES were evaluated either in physical terms or score points. Economic ES evaluation was not the goal of the first phase of the project.

Ecosystem services were evaluated on three indicators:

- **Provided** - ES produced by ecosystems regardless of the presence or absence of people (corresponds to the "potentials", i.e. the hypothetical maximum ES yield which can be potentially used by people; is not equal to "supply" after Burkhard et al. (2014), because doesn't account anthropogenic inputs).
- **Required** - ES yield necessary to fulfill the needs of population and economy of a region (is close to "demand" after Bastian et al. (2013) but differs from "demand" in the concept of Burkhard et al. (2014)).
- **Consumed** - the yield which is materially or immaterially in use of population, or which people made the benefits of (is similar to "flows" (Burkhard et al., 2014) which means de facto used set of ES and other outputs from natural systems in a particular area within a given time period; in some cases is similar to "demand" in terms of Burkhard et al. (2014) which mean ecosystem goods and services currently consumed or used in a particular area, not considering where ecosystem services actually are provided).

Ratios and differences of ES volumes show the level of use of ES, relative provision and satisfaction of needs in ES

$V_{provided}/V_{consumed}$	The level of ES use
$V_{consumed}/V_{provided} \times 100\%$	Unused (if positive) or overdrawn (if negative) ES volume
$V_{provided} - V_{consumed}$	
$V_{provided}/V_{required}$	The level of providing of ES
$V_{required}/V_{provided} \times 100\%$	Excess (if positive) or deficiency (if negative) of ES
$V_{provided} - V_{required}$	
$V_{required}/V_{consumed}$	The satisfaction of needs in ES
$V_{consumed}/V_{required} \times 100\%$	Volume of unmet need for ES
$V_{required} - V_{consumed}$	

The main conclusions

- The potential capacity of ES of Russia is comparable with needs of the people.
- A number of the most important life-supporting services are already fully used or even overused.
- Because of uneven space distribution of provided, required and consumed ES regions are divided into donors and beneficiaries of ES.

ES assessment reveals requirements to the national ES monitoring system:

- Monitoring and prognosis of biodiversity status as the basis for ES.
- Accounting for the full value of ecosystem services, including all major groups, primarily, regulating (environment-forming) ES.
- Assessment by three indicators: provided, required, consumed ES
- Accounting for spatial scales of ecosystem functions and ES.

The next step: project "TEEB-Russia 2. Biodiversity and Ecosystem Services: Management Principles in Russia"

Project goals:

- To evaluate the importance of biodiversity of Russia in maintenance of ES and formulate requirements for the national system of monitoring and management of ES and biodiversity of Russia.
- Further development of the framework methodology and indicators for ascertainment of ES and biodiversity in accordance with international standards as well as specific Russian conditions and scientific

Methods of assessment

- Direct quantitative
- Indirect quantitative
- Score in points
- Formulation of task

ECOSYSTEM SERVICES

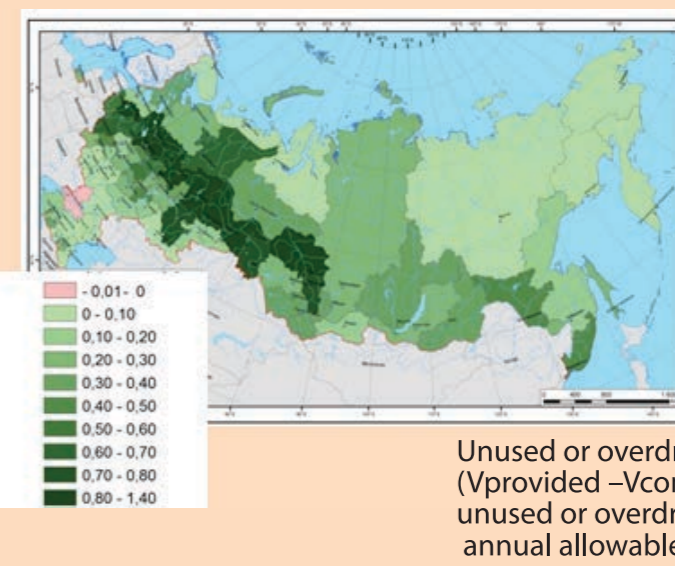

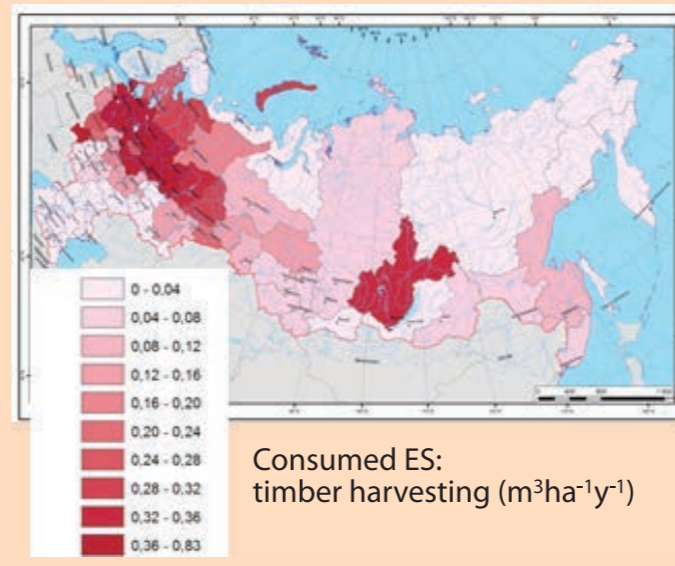

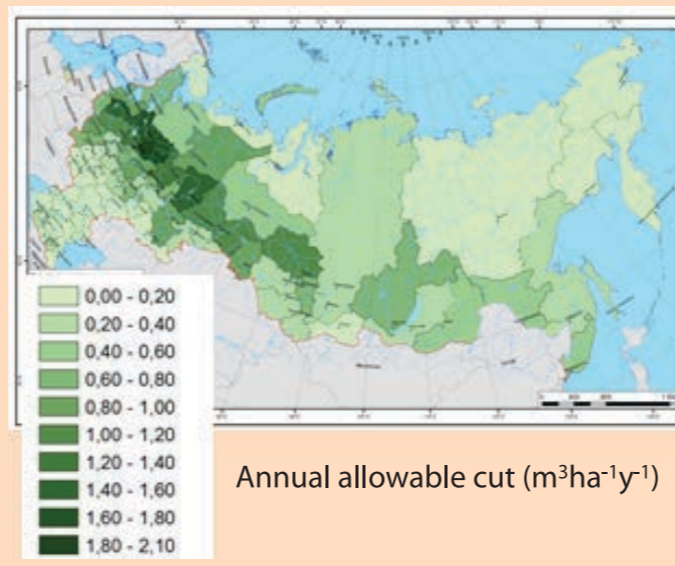

Provisioning (Productive)

Production of timber and firewoods	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Production of non-wood plant resources	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Production of fodder by natural pastures and hayfields	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Production of fresh-water seafood	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Production of game resources	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Production of honey from natural meadows	Direct quantitative	Indirect quantitative	Score in points	Formulation of task

PROVIDED ES

CONSUMED or REQUIRED ES

Level of use, provision or satisfaction of needs in ES

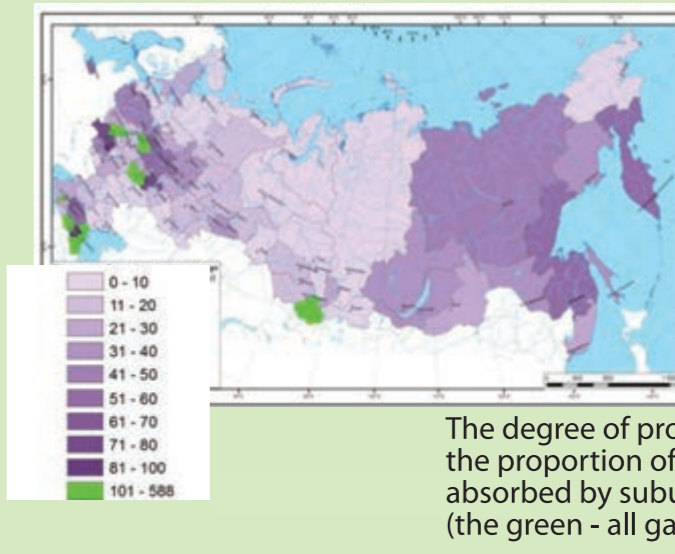

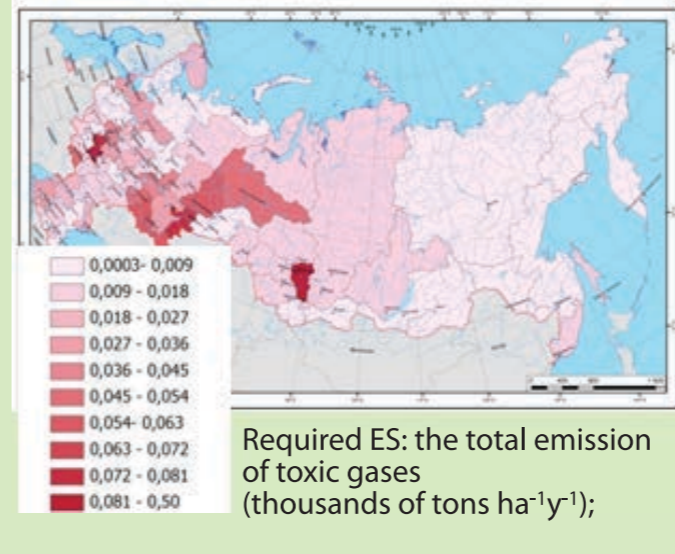

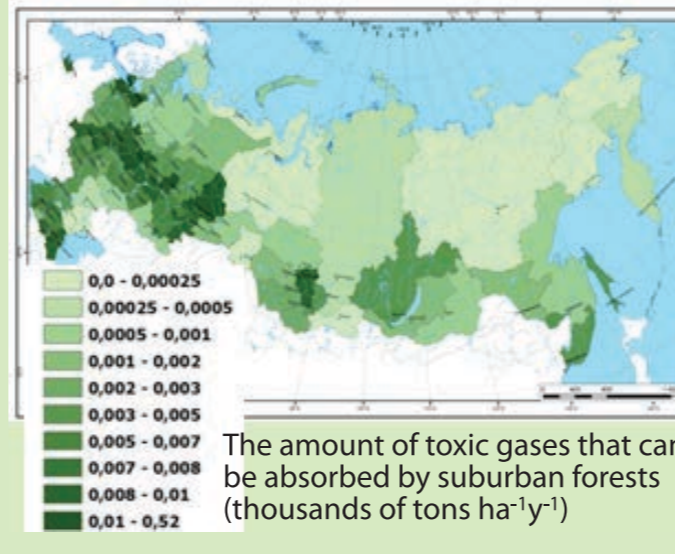

Wood production

Regulating (Environment-forming)

Regulation of climate and atmosphere

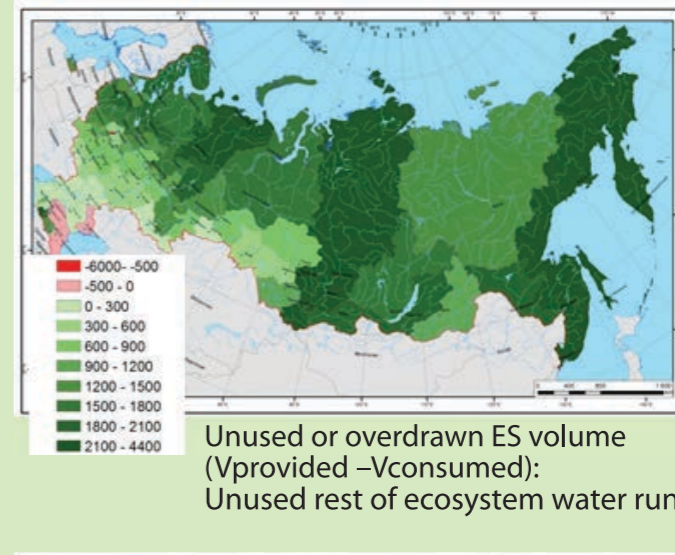

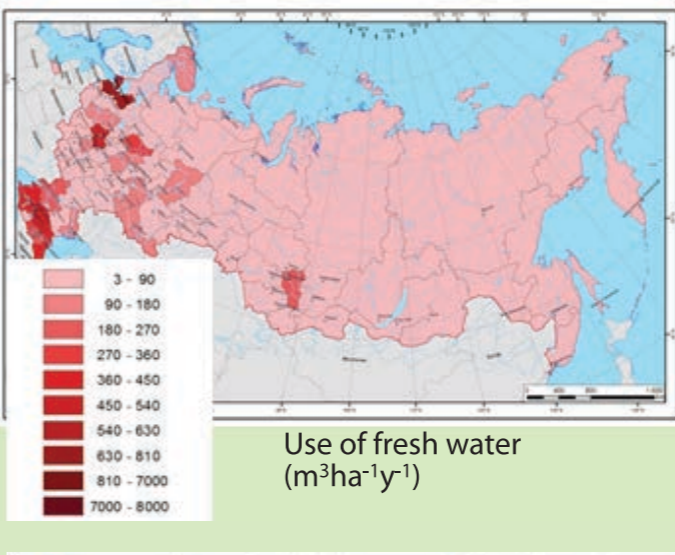

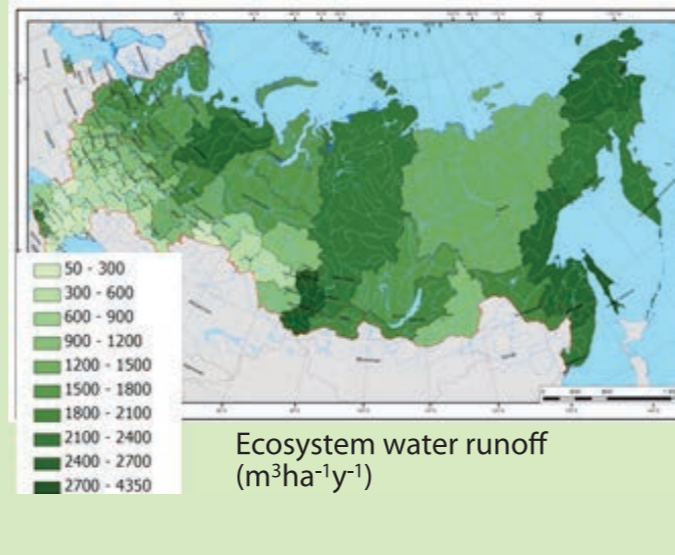

Biogeochemical regulation of climate (carbon, GHG)	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Biogeophysical regulation of climate	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Purification of air by vegetation	Direct quantitative	Indirect quantitative	Score in points	Formulation of task

Air purification by suburban forests

Regulation of hydrosphere

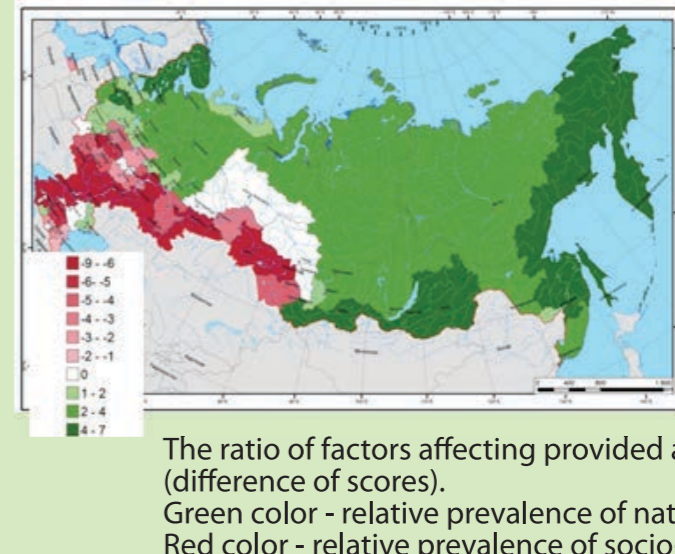

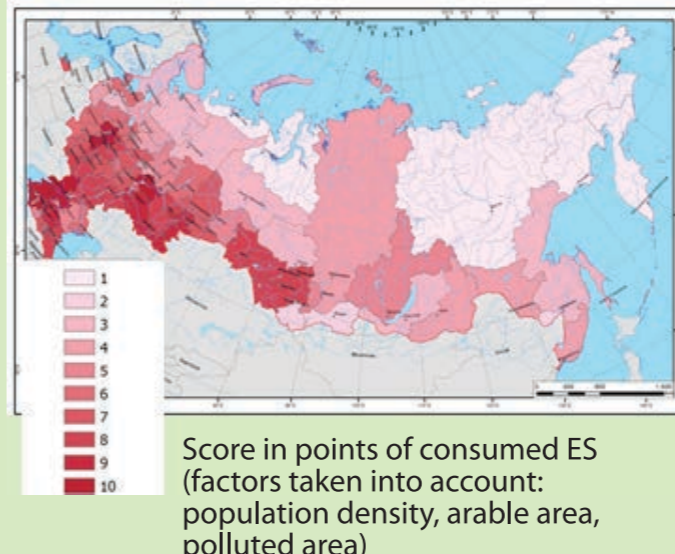

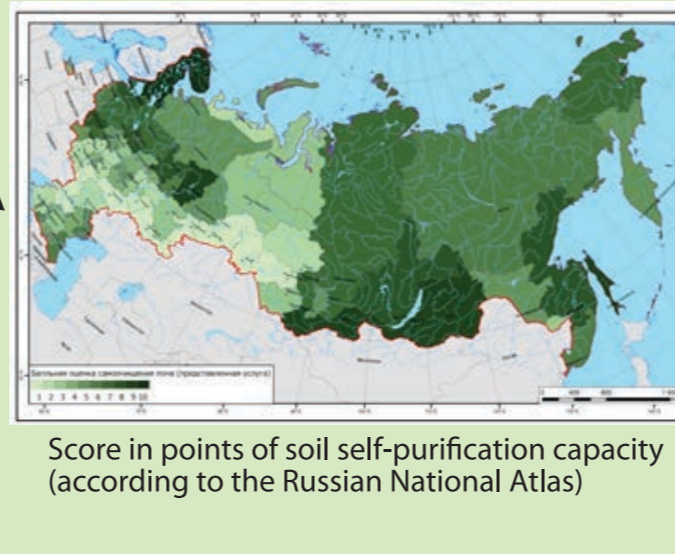

Regulation of water run-off	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Providing of water quality by terrestrial ecosystems	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Self-cleaning of water in aquatic ecosystems	Direct quantitative	Indirect quantitative	Score in points	Formulation of task

Ecosystem regulation of runoff

Forming and protection of soils

Protection from water and wind erosion	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Prevention of landslides	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Forming of bioproductivity of soils	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Biological cleaning of soils, removal of pollutants	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Regulation of cryogenic processes	Direct quantitative	Indirect quantitative	Score in points	Formulation of task

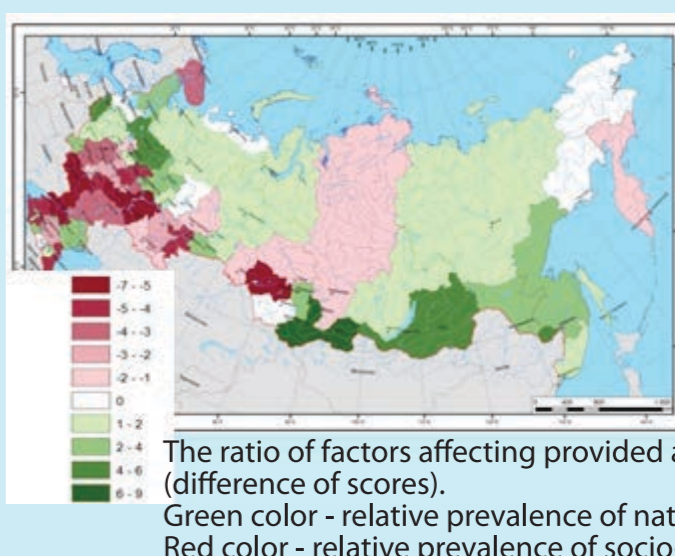

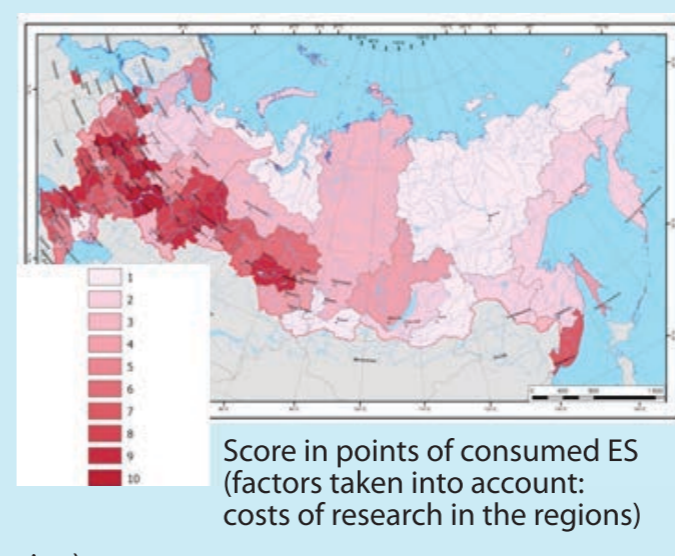

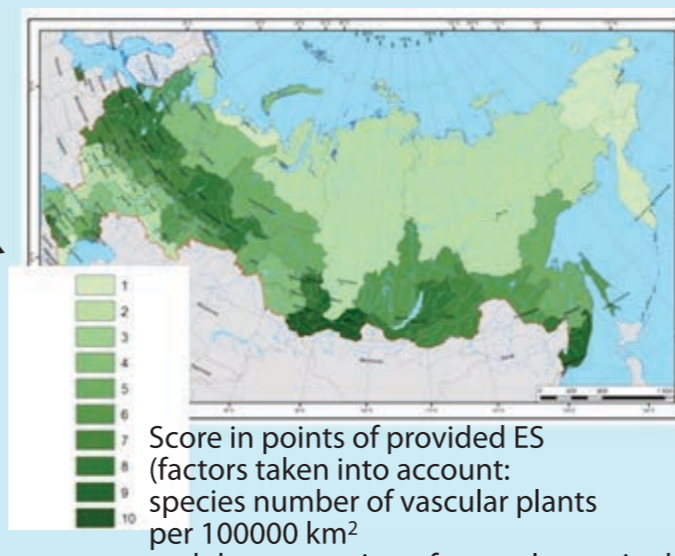

Self-purification of soils

Regulation of biological processes which are important for economy and safety

Regulation of agriculture and forest pests	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Regulation of pollinators	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Regulation of species which have medical importance	Direct quantitative	Indirect quantitative	Score in points	Formulation of task

Cultural (Informational)

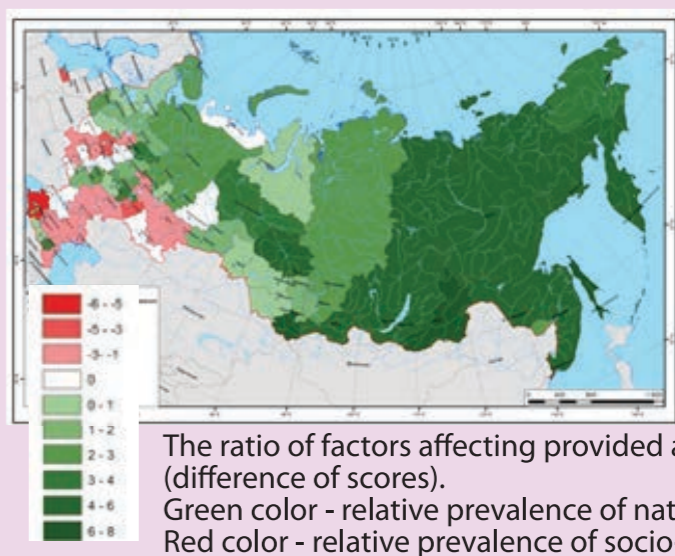

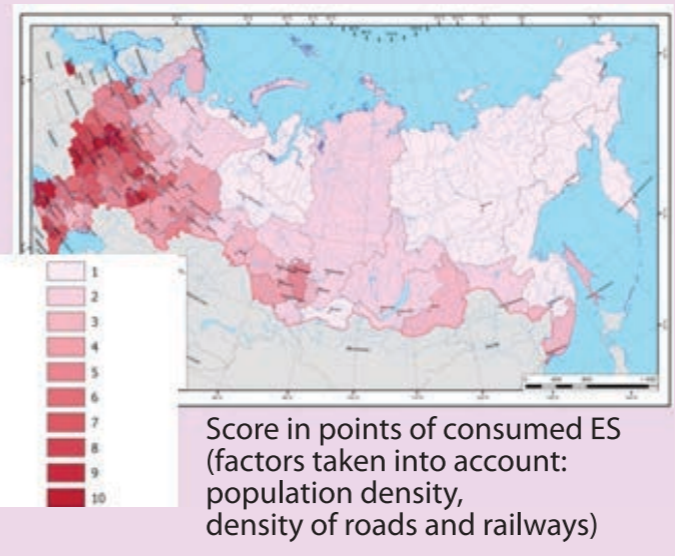

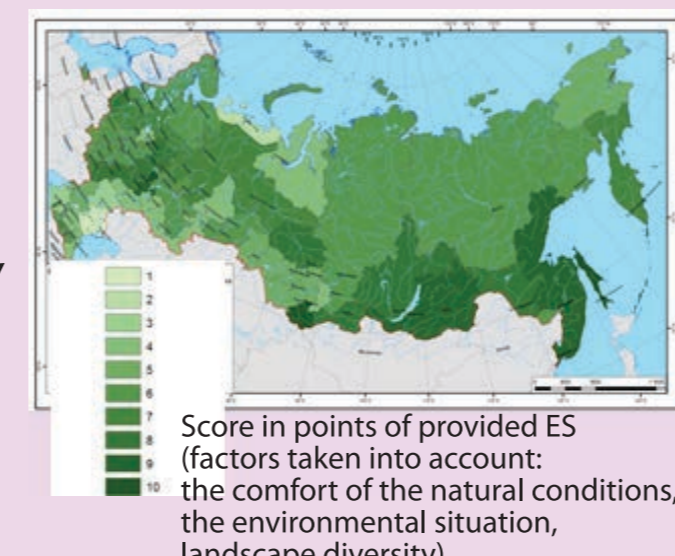

Genetic resources of native species and populations	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Information about structure/functioning of natural systems	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Aesthetic and cognitive value of natural systems.	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Ethical, spiritual, religious significance of natural systems	Direct quantitative	Indirect quantitative	Score in points	Formulation of task

Natural genetic resources

Recreational

Formation of natural conditions for the following types of recreation:	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Daily and weekend recreation	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Educational and active tourism in nature	Direct quantitative	Indirect quantitative	Score in points	Formulation of task
Wellness recreation at resorts	Direct quantitative	Indirect quantitative	Score in points	Formulation of task

Natural conditions for tourism in nature
